## 1. FUNCTIONAL LANGUAGE

Term	Definition
Functional programming	Style of programming with the focus on application of functions to arguments
Functional language	Languages that encourage functional programming

### 1.1. ALGEBRA

**TODO:** ...

- Equational reasoning
- Proving correctness of programs

---

## 2. HASKELL

### 2.1. FUNCTION DEFINITION

```
funName :: (TypeBound a) => a → b -- type definition
funName x = show x -- implementation
```

### 2.2. FUNCTION APPLICATION

```
sum [1..5]
```

### 2.3. TYPES

A Type in Haskell is a name for a collection of related values.

### 2.4. TYPECLASSES

-- TODO

#### 2.4.1. Functor

#### 2.4.2. Applicative

#### 2.4.3. Monad

### 2.5. LAZY EVALUATION

### 2.6. EQUATIONAL REASONING

### 2.7. LIST COMPREHENSION

### 2.8. TODO:

- Effectful functions
- Dependent typing
- Mutable state + parallel programming

---

## 3. LAMBDA CALCULUS

- Alonzo Church
