OPTIMISTISCHES LOCKVERFAHREN

Growing phase

The diagram illustrates the two-phase locking protocol (2PL) with two phases: Growing phase and Shrinking phase.

Growing phase: Transaction T1 starts by acquiring XLOCK(A) and then W(A). It then acquires R(A) and finally COMMIT. Transaction T2 starts by acquiring SLOCK(A) and then R(A). Transaction T1's COMMIT is marked as OK.

Shrinking phase: Transaction T1 releases its locks (XLOCK(A), W(A), R(A), and COMMIT). Transaction T2 releases its locks (SLOCK(A) and R(A)) and then COMMIT. Transaction T1's COMMIT is marked as OK.

The diagram shows two transactions, T1 and T2, each with a sequence of operations in a table. T1's operations are SLOCK(A), XLOCK(B), UNLOCK(A,B), and COMMIT. T2's operations are SLOCK(B), XLOCK(A), UNLOCK(A), and COMMIT. Red arrows indicate dependencies: T1's COMMIT depends on T2's UNLOCK(A), and T2's UNLOCK(A) depends on T1's COMMIT. Both transactions are in a 'Wartet auf' (waiting) state, leading to a deadlock.

T1		T2	
SLOCK(A)	R(A)	SLOCK(B)	R(B)
XLOCK(B)	W(B)	XLOCK(A)	W(A)
UNLOCK(A,B)	COMMIT	UNLOCK(A)	R(B)
			COMMIT

⇒ Deadlock

SERIALISIERBARKEIT

Serieller Schedule: Führt Transaktionen am Stück aus
Nicht serialisierbar:

01-B1/ \B0/ \H1/ \B

$$S1 = R1(x) \underbrace{R2(x) W1(x)}_{\text{R2W1}} R1(y) W2(x) W1(y)$$

Konfliktpaare:

$$R1(x) < W2(x)$$

Konflikt-Serialisierbar:

Konflikt-Äquivalenter serieller Schedule:
 $r_1(b)r_2(b)w_2(b)r_2(c)r_2(d)w_3(a)r_3(b)r_5(c)r_5(a)r_4(d)w_4(d)w_4(c)$

Begriff	Definition
Seriell	Alle T in einem Schedule sind geordnet
Konfliktäquivalent	Reihenfolge aller Paare von konfligierenden Aktionen ist in beiden Schedules gleich
Konfliktserialisierbar	Ein S ist konfliktäquivalent zu einem seriellen S
