

GENERICS

// class
class Box<T> {}

// variable
Box<String> b = new Box<String>();
// method
public <T> void doStuff(T value) {}

JAVA BEING STUPID

T obj = new T(); // error
obj instanceof T; // error
T heh = (T) "asdf"; // no typechecking
var s = Stack<int>(); // no primitive types
private static T x; // static no workkey
Node<Number> s = new Node<Integer>; // error
class IThrowAnErrorBecauseWhyNot {
 void m(List<String> list) {}
 void m(List<Integer> list) {}
} // error because of type erasure & identifiability

ITERATOR

for (String s : stringList) {} // ==
for (Iterator<String> i = stringList.iterator();
 i.hasNext();) {
 String s = i.next();
}

ITERABLE

interface Iterable<T> {
 Iterator<T> iterator();
}

interface Iterator<E> {
 boolean hasNext();
 E next();
}

COMPARABLE

TODO:
Type signature?

static <T extends Comparable> T doStuff(T a, T b) {
 // compareTo is possible with all types
 return a.compareTo("b") > 0 ? a : b;
}

static <T extends Comparable<T>> T doStuff(T a, T b)
{
 // compareTo is possible only with T
 return a.compareTo(b) > 0 ? a : b;
}

EXAMPLE

class Graphic {
 public void draw() {}
}

class Rectangle extends Graphic {
}
class Circle extends Graphic {
}
class GraphicStack<T extends Graphic>
 extends Stack<T> {
 public void drawAll() {
 for (T item : this) item.draw();
 }
}

BYTECODE

TODO:

TYPE ERASURE

– Introduced because of "bAcKwArDs CoMpAtAbIlItY"
– No type information at runtime (Non-Reifiable Type)

class MyStack<T> {
 Entry<T> top;
 int push(T value) {}
}

// becomes
class MyStack {
 Entry top;
 int push(Object value) {}
}

/* with bounds */
class MyStack<T extends Comparable<T>> {
 Entry<T> top;
 int push(T value) {}
}

// becomes
class MyStack {

Entry top;
int push(Comparable value) {}
}

/* what happens at/before runtime */
MyStack<String> s = new MyStack<String>();
s.push("Eh");
String x = s.pop();
// becomes
MyStack s = new MyStack();
s.push("Eh");
String x = (String) s.pop();

WILDCARDS

void printGs(List<Graphic> gs) {}
List<Graphic> gs1 = new ArrayList<>();
printGs(gs1); // ok
List<Circle> gs2 = new ArrayList<>();
printGs(gs2); // error
/* solution */
void printGs(List<? extends Graphic> gs) {}

GENERIC VARIANCE

@Max(value = 99, message = "Age must be ≤ 99")
private int age;
@NotNull(message = "Name cannot be null")
private String name;

ALGORITHMS

– Brute-force
– Greedy
– Take best option each step (optimize locally)
– Fast
– Backtracking
– Trial and error
– Best overall option
– Higher compute costs
– Divide and conquer
– Binary search
– Dynamic programming
– Recursion optimization?
– Tabulation

BACKTRACKING

TODO:
slides 87

BIG O NOTATION

– Worst case scenario
– Atomic operations = constant time
– Runtime measured as sum of primitive operations

Notation

Algorithm $\tilde{f}$ $\left(\underbrace{n}_{\text{Size of problem}} \right)$ = Number of steps

g = complexity class

TODO:
diagram $f \leq cg$

$f(n)$ is $O(g(n))$ if $c > 0 \wedge n_0 \geq 1$
 $f(n) \leq cg(n)$ for $n \geq n_0$

f in order g:

Let $f, g: \mathbb{N} \rightarrow \mathbb{N}$
 $n_0, c \in \mathbb{N} \wedge \forall n \geq n_0: f(n) \leq c \cdot g(n)$
 $\Rightarrow f \in O(g) \Leftrightarrow f = O(g)$

Big O

$\widetilde{O} \left(\underbrace{n}_{\text{Size of problem}} \right)$ = Complexity class

RULES

If $f(n)$ is polynomial of degree d , then $f(n) \in O(n^d)$
– ignore lower powers
– ignore constants

Use most optimal function (lowest power)
– $2n$ is $O(n)$ better than $2n$ is $O(n^2)$

Simplify as far as possible
– $3n + 5$ is $O(n)$ instead of $3n + 5$ is $O(3n)$

COMPLEXITY CLASSES

Name	Class	Example
Constant	1	Array read
Logarithmic	$\log n$	Binary search
Linear	n	Linear search
Log-linear	$n \log n$	Merge+Quick sort
Quadratic	n^2	Bubble+Insertion sort
Cubic	n^3	Solve equation
Polynomial	n^k	Various algorithms
Exponential	2^n	Calculate all subsets
Factorial	$n!$	Calculate all permutations

TODO:
Counting primitive operations (slides 55)

SORTING ALGORITHMS

SELECTION SORT

– Search for smallest elem in unsorted part and move in front

- Less mutations in array
- Same performance even if list almost sorted

```
public static void selectionSort(int[] a) {
    int n = a.length;
    for (int i = 0; i < n - 1; i++) {
        int minimum = i;
        for (int j = i + 1; j < n; j++)
            if (a[j] < a[minimum])
                minimum = j;
        swap(a, i, minimum);
    }
}
```

$$(n-1) + (n-2) + \dots + 1 = \sum_{i=1}^{n-1} i = \frac{n(n-1)}{2} = \frac{n^2-n}{2} \sim O(n^2)$$

- INSERTION SORT**
- Take elem and put into correct place in sorted part
 - Good for already partially sorted arrays

```
public static void insertionSort(int[] a) {
    int n = a.length;
    for (int i = 1; i < n; i++)
        for (int j = i; j > 0 && a[j] < a[j - 1]; j--)
            swap(a, j, j - 1);
}
```

$$1 + \dots + (n-1) + n = \sum_{i=1}^n i = \frac{n(n+1)}{2} = \frac{n^2+n}{2} \sim O(n^2)$$

- BUBBLE SORT**
- Compare neighboring elems and swap if needed

```
public static void bubbleSort(int[] a) {
    for (n = a.length; n > 1; n--)
        for (i = 0; i < n - 1; i++)
            if (a[i] > a[i + 1])
                swap(a, i, i + 1);
}
```

$$(n-1) + (n-2) + \dots + 1 = \sum_{i=1}^{n-1} i = \frac{n(n-1)}{2} = \frac{n^2-n}{2} \sim O(n^2)$$

```
public static void countingSort(int[] a) {
    int k = Arrays.stream(arr).max().getAsInt();
    int[] c = new int[k + 1];
    for (int i : a) c[i]++;
    int pos = 0;
    for (int i = 0; i < k; i++)
        for (int j = 0; j < c[i]; j++) {
            a[pos] = i;
            pos++;
        }
}
```

$$n + n + k + n = 3n + k \sim O(n + k)$$

- SHELL SORT**
- Sort pairs of far away elems
 - Sort the partially sorted array through insertion sort

```
public static void shellSort(int[] a) {
    int n = a.length;
    int h = 1;
    while (h < n/3) h = 3 * h + 1;
    while (h >= 1) {
        for (int i = h; i < n; i++)
            for (int j = i; j >= h && a[j] < a[j - h]; j = j - h) swap(a, j, j - h);
        h /= 3;
    }
}
```

BINARY SEARCH

```
public static <T extends Comparable<T>> boolean bs(
    List<T> data, T target, int low, int high) {
    if (low > high) return false;
    int pivot = low + ((high - low) / 2);
    if (target.equals(data.get(pivot)))
        return true;
    else if (target.compareTo(data.get(pivot)) < 0)
        return searchBinary(data, target, low, pivot - 1);
    else
        return searchBinary(data, target, pivot + 1, high);
}
```

```
return searchBinary(data, target, pivot + 1, high);
}
```

$$O(\log n)$$

RECURSION

When a function calls itself

LINEAR RECURSION

Recursive call starts **at most one** further recursive call

TODO:

recursive → iterative (slides 61)

TAIL RECURSION

Linear recursion where the recursive call is **last**

TODO:

recursive → iterative (slides 69 – nice)

BINARY RECURSION

All non-terminal calls have **two** recursive calls

TODO:

example (slides 76,77,78)

TODO:

$O(n)$ (slides 84)

DATA STRUCTURES

ADT: Abstract Data Type (e.g. Interface)

TODO:

diagram

PRIORITY QUEUE

Method	Unsorted List	Sorted List
insert	$O(1)$	$O(n)$
min	$O(n)$	$O(1)$
removeMin	$O(n)$	$O(1)$

HEAP

- Binary tree
- Layers 0, ..., $h-1$ fully populated, layer h filled from left
- Operations always lowest RHS so that tree stays consistent

Min-Heap: Keys of nodes are **smaller** or equal than children's

Max-Heap: Keys of nodes are **larger** or equal than children's

HEAP SORT

Dequeue elems from head into list, resorting tree on each iter

TODO:
