

GENERIC

```
// class
class Box<T> {
    // variable
    Box<String> b = new Box<String>();
    // method
    public <T> void doStuff(T value) {}
}

// error
obj instanceof T;
T heh = (T) "asdf"; // no typechecking
var s = Stack<int>(); // no primitive types
private static T x; // static no workey
Node<Number> s = new Node<Integer>; // error
class IThrowAnErrorBecauseWhyNot {
    void m(List<String> list) {}
    void m(List<Integer> list) {}
} // error because of type erasure & identifiability
```

ITERATOR

```
for (String s : stringList) {} // =
for (Iterator<String> i = stringList.iterator();
    i.hasNext(); ) {
    String s = i.next();
}
```

ITERABLE

```
interface Iterable<T> {
    Iterator<T> iterator();
}

interface Iterator<E> {
    boolean hasNext();
    E next();
}
```

COMPARABLE

TODO:
Type signature?

```
static <T extends Comparable> T doStuff(T a, T b) {
    // compareTo is possible with all types
    return a.compareTo("b") > 0 ? a : b;
}

static <T extends Comparable<T>> T doStuff(T a, T b) {
    // compareTo is possible only with T
    return a.compareTo(b) > 0 ? a : b;
}
```

EXAMPLE

```
class Graphic {
    public void draw() {}
}

class Rectangle extends Graphic {}
class Circle extends Graphic {}
class GraphicStack<T> extends Graphic<
    extends Stack<T> {
    public void drawAll() {
        for (T item : this) item.draw();
    }
}
```

BYTECODE

TODO:

TYPE ERASURE

– Introduced because of “bAcKwArDs CoMpAtAbIlItY”

– No type information at runtime (Non-Reifiable Type)

```
class MyStack<T> {
    Entry<T> top;
    int push(T value) {}
}

// becomes
class MyStack {
    Entry top;
    int push(Object value) {}
}

/* with bounds */
class MyStack<T extends Comparable<T>> {
    Entry<T> top;
    int push(T value) {}
}
```

```
// becomes
class MyStack {
    Entry top;
    int push(Comparable value) {}
}

/* what happens at/before runtime */
MyStack<String> s = new MyStack<String>();
s.push("Eh");
String x = s.pop();
// becomes
MyStack s = new MyStack();
s.push("Eh");
String x = (String) s.pop();
```

WILDCARDS

```
void printGs(List<Graphic> gs) {}
List<Graphic> gs1 = new ArrayList<>();
printGs(gs1); // ok
List<Circle> gs2 = new ArrayList<>();
printGs(gs2); // error
/* solution */
void printGs(List<? extends Graphic> gs) {}
```

GENERIC VARIANCE

```

ALGORITHMS

– Brute-force

– Greedy

– Take best option each step (optimize locally)

– Fast

– Backtracking

– Trial and error

– Best overall option

– Higher compute costs

– Divide and conquer

– Binary search

– Dynamic programming

– Recursion optimization?

– Tabulation

BACKTRACKING

TODO:
slides 87

BIG O NOTATION

- Worst case scenario
- Atomic operations = constant time
- Runtime measured as sum of primitive operations

Notation

Algorithm $\overbrace{f}^{\underbrace{n}_{\text{Size of problem}}}$ = Number of steps

g = complexity class

TODO:
diagram $f \leq cg$

$f(n)$ is $O(g(n))$ if $c > 0 \wedge n_0 \geq 1$
 $f(n) \leq cg(n)$ for $n \geq n_0$

f in order g :

Let $f, g : \mathbb{N} \rightarrow \mathbb{N}$

$n_0, c \in \mathbb{N} \wedge \forall n \geq n_0 : f(n) \leq c \cdot g(n)$

$\Rightarrow f \in O(g) \Leftrightarrow f = O(g)$

Big O

Big O $\widehat{O} \left(\underbrace{n}_{\text{Size of problem}} \right)$ = Complexity class

RULES

If $f(n)$ is polynomial of degree d , then $f(n) \in O(n^d)$

– ignore lower powers

– ignore constants

Use most optimal function (lowest power)

– $2n$ is $O(n)$ better than $2n$ is $O(n^2)$

Simplify as far as possible

– $3n + 5$ is $O(n)$ instead of $3n + 5$ is $O(3n)$

COMPLEXITY CLASSES

Name	Class	Example
Constant	1	Array read
Logarithmic	$\log n$	Binary search
Linear	n	Linear search
Log-linear	$n \log n$	Merge+Quick sort
Quadratic	n^2	Bubble+Insertion sort
Cubic	n^3	Solve equation
Polynomial	n^k	Various algorithms
Exponential	2^n	Calculate all subsets
Factorial	$n!$	Calculate all permutations

TODO:
Counting primitive operations (slides 55)

SORTING ALGORITHMS

SELECTION SORT

- Search for smallest elem in unsorted part and move in front
- Less mutations in array
- Same performance even if list almost sorted

```
public static void selectionSort(int[] a) {
    int n = a.length;
    for (int i = 0; i < n - 1; i++) {
        int minimum = i;
        for (int j = i + 1; j < n; j++)
            if (a[j] < a[minimum])
                minimum = j;
        swap(a, i, minimum);
    }
}
```

$$(n-1) + (n-2) + \dots + 1 = \sum_{i=1}^{n-1} i = \frac{n(n-1)}{2} = \frac{n^2-n}{2} \sim O(n^2)$$

INSERTION SORT

- Take elem and put into correct place in sorted part
- Good for already partially sorted arrays

```
public static void insertionSort(int[] a) {
    int n = a.length;
    for (int i = 1; i < n; i++)
        for (int j = i; j > 0 && a[j] < a[j - 1]; j--)
            swap(a, j, j - 1);
}
```

$$1 + \dots + (n-1) + n = \sum_{i=1}^n i = \frac{n(n+1)}{2} = \frac{n^2+n}{2} \sim O(n^2)$$

BUBBLE SORT

- Compare neighboring elems and swap if needed

```
public static void bubbleSort(int[] a) {
    for (n = a.length; n > 1; n--)
        for (i = 0; i < n - 1; i++)
            if (a[i] > a[i + 1])
                swap(a, i, i + 1);
}
```

$$(n-1) + (n-2) + \dots + 1 = \sum_{i=1}^{n-1} i = \frac{n(n-1)}{2} = \frac{n^2-n}{2} \sim O(n^2)$$

COUNTING SORT

```
public static void countingSort(int[] a) {
    int k = Arrays.stream(arr).max().getAsInt();
    int[] c = new int[k + 1];
    for (int i : a) c[i] += 1;
    int pos = 0;
    for (int i = 0; i < k; i++)
        for (int j = 0; j < c[i]; j++) {
            a[pos] = i;
            pos++;
        }
}
```

$$n + n + k + n = 3n + k \sim O(n + k)$$

SHELL SORT

- Sort pairs of far away elems
- Sort the partially sorted array through insertion sort

```
public static void shellSort(int[] a) {
    int n = a.length;
    int h = 1;
    while (h < n/3) h = 3 * h + 1;
    while (h >= 1) {
        for (int i = h; i < n; i++)
            for (int j = i; j >= h && a[j] < a[j - h];
                j = j - h) swap(a, j, j - h);
        h /= 3;
    }
}
```

BINARY SEARCH

```
public static <T extends Comparable<T>> boolean bs(
    List<T> data, T target, int low, int high) {
    if (low > high) return false;
    int pivot = low + ((high - low) / 2);
    if (target.equals(data.get(pivot)))
        return true;
    else if (target.compareTo(data.get(pivot)) < 0)
        return searchBinary(data, target, low,
            pivot - 1);
    else
        return searchBinary(data, target, pivot + 1,
            high);
}
```

$$O(\log n)$$

RECURSION

When a function calls itself

LINEAR RECURSION

Recursive call starts **at most one** further recursive call

TODO:
recursive → iterative (slides 61)

TAIL RECURSION

Linear recursion where the recursive call is **last**

TODO:
recursive → iterative (slides 69 – nice)

BINARY RECURSION

All non-terminal calls have **two** recursive calls

TODO:
example (slides 76,77,78)

TODO:
 $O(n)$ (slides 84)
