COMMUTATIVE DIAGRAMS

GRADIENT DESCENT / NEWTON'S METHOD

GD $x_{i+1} = x_i - \gamma \cdot \nabla f(x_i)$

N $x_{i+1} = x_i - \gamma \cdot (H_{f(x_i)})^{-1} \cdot \nabla f(x_i)$

γ = step size

termination criterion $\varepsilon > |x_{i+1} - x_i|$

Gradient descent doesn't always produce global minimum:

- If the function has more than one local minimum it could output that → run with different starting points
- Could output a stationary point that is not minimal (unlikely). → run with different starting points
- Could not terminate at all if step size / learning rate is so big (overshoots minimal point). Likely to happen if the graph of the function is narrow around the minimal point. → choose smaller step size

$\Rightarrow \begin{cases} F_X(g(y)) = P(Y(\omega) \leq y) = F_Y(y) & g \text{ increasing} \\ F_X(g(y)) = P(Y(\omega) \geq y) = 1 - F_Y(y) & g \text{ decreasing} \end{cases}$

$\Rightarrow \begin{cases} f_X(g(y)) \cdot g'(y) = f_Y(y) & g \text{ increasing} \\ f_X(g(y)) \cdot g'(y) = -f_Y(y) & g \text{ decreasing} \end{cases}$

EXAMPLES

WORKING WITH INDICES

$x, y \in \mathbb{R}^n, f: \mathbb{R}^n \rightarrow \mathbb{R}$

$f(x) = (x - y)^T (3x - y) = \sum_{i=1}^n (x_i - y_i)(3x_i - y_i)$

$\partial_{x_i} f(x) = (3x_i - y_i) + 3(x_i - y_i)$

$\frac{\partial}{\partial x_{ij}} f_{kl}(X) = \frac{\partial}{\partial x_{ij}} \sum_r x_{kr} a_{rl} = \sum_r \delta_{ik} \delta_{jr} a_{rl} = (E_{ij} \cdot A)_{kl}$

CALCULATING LIKELIHOOD FUNCTION

Given the following data and the probability density of the form

$f(t) = \lambda e^{-\lambda t} \cdot \mathbb{1}_{(0,\infty)}(t)$

x	y
1	7
2	16
3	32
4	44

find a formula for the likelihood function:

$l(\lambda) = f(7) \cdot f(16) \cdot f(32) \cdot f(44) = \lambda^4 e^{-99\lambda}$

Find a formula for the negative log-likelihood:

$-\ln(l(\lambda)) = -\ln(\lambda^4 e^{-99\lambda}) = 99\lambda - 4 \ln(\lambda)$

calculate the probability density function $f_Y(y)$

$|f_Y(y) dy| = |f_X(x) dx|$
 $\Leftrightarrow f_Y(y) = f_X(x) \cdot \frac{dx}{dy}$

$y = \frac{1}{1 + e^{-x}}$
 $\Leftrightarrow x = -\ln\left(\frac{1}{y} - 1\right), \quad 0 < y < 1$
 $\Rightarrow \frac{dx}{dy} = -\frac{1}{\frac{1}{y} - 1} \cdot \frac{-1}{y^2} = \frac{1}{y - y^2}$

$\Rightarrow f_Y(y) = X_{[0,\infty)}(x) \cdot e^{-x} \cdot \frac{1}{y - y^2}$
 $= \frac{1}{y^2} \cdot X_{[0,\infty)}\left(-\ln\left(\frac{1}{y} - 1\right)\right)$

$-\ln\left(\frac{1}{y} - 1\right) \geq 0 \Leftrightarrow y \geq \frac{1}{2}$

$\Rightarrow X_{[0,\infty)}\left(-\ln\left(\frac{1}{y} - 1\right)\right) \stackrel{y \in (0;1)}{=} X_{[\frac{1}{2};1)}(y)$
