1. MACHINE LEARNING (ML)

There are many different AI research fields and AI applications. Algorithms and applications where a computer learns from data are typically in the field of statistical machine learning (ML).

Computer: performs a mapping from input to output.

Processing: any sort of non-trivial “calculation” (mapping) or information processing

Input: any sort of data/information (sensory input, bits, mechanical configuration...)

Output: any sort of response (data, actions, new state of a system...)
